                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         May MJ,
  The invention relates to modulating NF-kappaB (NF-kB) induction in a cell comprises contacting act least one NEWO binding domain (ABB08773-ABB08742) comprising at least one NEWO binding domain (ABB77313). The compound has acts through selective inhibition of (ABB0877313). The compound has acts through selective inhibition of NEWO binding domain. Blockage of IXKbeta-NEWO with IXKbeta at the NEWO binding domain. Blockage of IXKbeta-NEWO interaction results in inhibition of IXKbeta kinase activation and subsequent decreased phosphorylation of IXKbeta kinase activation and subsequent decreased phosphorylation of IXKbeta kinase activation and cat (directly or indirectly) by blocking the recruitment of leukocytes at the orapound is useful in treating NP-KB mediated atfrementation. The compound is useful in treating NP-KB mediated conditions, where the condition is an inflammatory disorder, an autoimmume disease, transplant rejection, osteoporosis, cancer, Alzheimer's disease, transplant rejection, osteoporosis, cancer, and anaphylaxis, cutaneosclerosis, a viral infection or ataxia catomicaria, anaphylaxis, cutaneosclerosis, a viral infection or ataxia utcidaria, anaphylaxis, cutaneosclerosis, a viral infection or ataxia catomicaria, anaphylaxis, uttaineous inflammatory disease, vasculitis and bursitis. The inflammatory disease, vasculitis and cutoidaria, school obstructive pulmonary disease, vasculitis and colymyalgia, scleroderma Wegner's granulomatosis, temporal arteritis, corpusing sponiatis. The inflammatory disease, ulcerative colitis, popolymyalgia, scleroderma Wegner's granulomatosis, temporal arteritis, colons caused by Epstein-barr, cytomegalovirus or herpes simpled. Corpusione and food sensitivity, contact dermatitis, curbating anaphylaxis, drug and food sensitivity, contact dermatitis, cumburn or aging. The compound may be useful for treating anaphylaxis, drug and food sensitivity, contact dermatitis, mumunosuppression in transplants and compound may be useful for the compound may be definitedered alone or
                                                                                                                                                                                                              Modulating NF-kappaB induction in a cell, useful for treating e.g. inflammatory disorders, osteoporosis and cancer, comprises contacting a cell with an anti-inflammatory compound comprising at least one NEMO

(AAM48620-AAM48619). The antinflammatory compounds have antiasthmatic, cytostatic, antipeoriatic, antirheumatic, antiarthritic, osteopathic, antibacterial, immunosuppressive, dermatological, neuroprotective, antibacterial, immunosuppressive, dermatological, neuroprotective, notropic, antiatherosclerotic, virucide and antiallergic activity. The compounds act as selective inhibitors of cytokine-mediated NFkappaB crivation by blocking interaction of IkappaB kinase beta (IKKbeta) at the NEWO binding domain that results in inhibition of IKAbpaB. The activation and subsequent decreased phosphorylation of IkappaB. The compounds are useful for treating inflammatory disorders, e.g. asthma, lung inflammation or cancer, psoriasis, rheumatoid arthritis, osteoarthritis, inflammatory bowel disease, sepsis, vasculitis, burstitis; autoimmune diseases such as lupus, polymyalgia, scleroderma, carantlematosis, multiple sclerosis, transplant rejection; osteoporosis; Alzheimer's disease; atherosclerosis, transplant rejection; and ataxia telangiectasia. The compounds are also useful for treating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö

The present invention relates to antiinflammatory compounds comprising NEMO binding domain (NBD) peptides. The NEMO binding domains are found on INABDAB kinase-beta (IXKOAETA) and IXABDAB kinase-balpha kinase-beta (IXKOAETA) and IXABDAB kinase-balpha antiinflammatory compounds of the invention are useful for modulating nuclear factor-kappaB (NF-kappaB) induction in a cell, where the compounds are capable of blocking the interaction between one or more IKKS such as IKKABIPHA or IKKDeta, and NEMO. The antiinflammatory compound further comprises at least one membrane translocation domain. The compounds are useful for treating inflammatory disorders, autoimmune diseases, osteoporosis, cancer, alzheimer's disease, atherosclerosis, viral infections, Ataxia telangiectesia, and for transplantation detection. The compounds of the invention block NF-kappaB induction by IKK but do not inhibit the basal activity of NF-kappaB. ABU08418-ABU08432 represent human Length 6; 100.0%; Score 33; DB 24; 100.0%; Pred. Modulating NF-kappaB induction in a cell, useful for treating e.g. inflammatory disorders, osteoporosis and cancer, comprises contacting a cell with an anti-inflammatory compound comprising at least one NEMO

Example 11; Page -; 82pp; English.

The invention relates to modulating NF-kappaB (NF-kB) induction in a cell comprises contacting a cell with an anti-inflammatory compound (ABB077313). The comprising at least one NEMO binding domain (ABB077313). The compound has acts through selective inhibition of cytokine-mediated NF-kB activation by blocking the interaction of NEMO cytokine-mediated NF-kB activation by blocking the interaction of NEMO compound in inhibition of IKKDeta kinase activation and subsequent decreased phosphorylation of IKKDeta kinase activation and interaction results in inhibition of IKKDeta kinase activation and cat (directly or indirectly) by blocking the recruitement of leukocytes into sites of acute and chronic inflammation, by down-regulating the expression of E-selectin on leukocytes or by blocking osteoclast confiferentiation. The compound is useful in treating NF-kB mediated confitients, where the compound is useful in treating osteoclast confitients, where the compound is useful in fraction or ataxia autoimmune disease, transplant rejection, osteoporosis, cancer, conditions, where the condition is an inflammatory disorder an autoimmune disease, transplant rejection, osteoporosis, cancer, contication, anaphylaxis, cutaneous inflammation, sepsis, psoriasis, crementation or ataxia crementation or ataxia crementation or ataxia crementation of arthritis, osteoarthritis, psoriatic arthritis, lupus and computed the sporiatic arthritis, lupus and substains, osteoarthritis, psoriatic arthritis, lupus and spondylarthritis. Also for Crohn's granulomatosis, temporal arteritis, cryoglobulinaemia or multiple sclerosis. For chronic viral infections caused by Epstein-barr, cytomegalovirus or herpes simplex. Other viral diseases include HIV and influenza. The compound may also be useful for treating anaphylaxis, drug and food sensitivity, contact dermatitis,

ö
sunburn or aging. The compound may be used to replace corticosteroids in any application in which corticosteroids are used, including immunosuppression in transplants and cancer therapp. Also for identifying antiinflammatory compounds and for diagnosis of an inflammatory disorder. The compound may be administered alone or in combination with other known anti-inflammatory agents. The present sequence is that of an IKKbeta mutant, useful in examples of the invention.

Note: The present sequence is not given in the specification but is derived from GenBank Accession No. 014920 (ABB77294).

ö
survival signal that protects cells from apoptosis induced in a variety of ways. Reduction of the activity of PDK1 may promote apoptosis and may be useful in treating cancer. Conditions in which aiding apoptosis may be of benefit may also include resolution of inflammation. A compound capable of increasing the activity of PDK1 may be useful in treating diabetes or obesity, or may be useful in inhibiting apoptosis. Increased activity of PDK1 may lead to increased levels of leptin, which may lead to weight loss. The compounds may suppress apoptosis, which may aid cell survival during or following cell damaging processes and in treating disease in which apoptosis is involved. Examples of the diseases include, mechanical (including heat) tissue injury or ischaemic disease, for example stroke and myocardial infarction, or neural injury. The present sequence represents a region of protein kinase C related protein kinase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention describes a method for identifying a compound that modulates protein kinase activity. The method comprises measuring the ability of the compound to inhibit, promote or mimic the interaction of a hydrophobic pocket-containing protein kinase with an interacting polypeptide. The interacting polypeptide interacts with the hydrophobic pocket of the protein kinase and/or comprises the amino acid sequence Phe/Tyr.Xaa.Xaa.Aaa.Phe/Tyr (I). The method is useful in screening assays for developing pharmaceutical compounds or drugs. Compounds, polypeptides or polynucleotides from the present invention are useful in medicine,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Identifying modulators of protein kinase (PK) activity, useful in developing drugs for treating cancer or diabetes, by measuring the ability of the compound to modulate or mimic the interaction of PK with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

in need of modulation of signalling by a hydrophobic pocket-containing protein kinase. Specifically, the patient has cancer or diabetes or is in need of inhibition of apoptosis, e.g. a patient suffering from tissue injury or ischaemic injury, including stroke. The compound or composition is also useful for inhibiting the degree or rate of phosphorylation by the protein kinase. The interacting polypeptide or compound is useful in methods of stabilising a hydrophobic pocket. Containing protein kinase, where the protein kinase is exposed to the compound or polypeptide or the protein kinase is exposed to the sequences, and AAH44210 and AAH44211 represent oligonucleotide sequences, used in the exemplification of the present invention.
   particularly in the manufacture of a medicament for treating a patient

Identifying modulators of protein kinase (PK) activity, useful in developing drugs for treating cancer or diabetes, by measuring the ability of the compound to modulate or mimic the interaction of PK with interacting polypeptides

Disclosure, Page 22; 180pp; English.

modulates protein kinese activity. The method comprises measuring the ability of the compound to inhibit, promote or mimic the interaction of a hydrophobic pocket-containing protein kinase with an interacting polypeptide interacts with the hydrophobic pocket of the protein kinase and/or comprises the amino acid sequence phe/Tyr-Xaa-Xaa-Phe/Tyr (1). The method is useful in screening assays for developing pharmaceutical compounds or drugs. Compounds, polypeptides or polynucleotides from the present invention are useful in medicine, particularly in the manufacture of a medicament for treating a patient in need of modulation of signalling by a hydrophobic pocket-containing The present invention describes a method for identifying a compound that

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention describes a method for identifying a compound that modulates protein kinase activity. The method comprises measuring the ability of the compound to inhibit, promote or minic the interaction of a hydrophobic pocket-containing protein kinase with an interaction of polypeptide. The interacting polypeptide interacts with the hydrophobic pocket of the protein kinase and/or comprises the amino acid sequence Phe/Tyr-Xaa-Xaa-Phe/Tyr (I). The method is useful in screening assays for developing pharmaceutical compounds or drugs. Compounds, polypeptides or polynucleotides from the present invention are useful in medicine, particularly in the manufacture of a medicament for treating a patient in need of modulation of signalling by a hydrophobic pocket-containing protein kinase. Specifically, the patient has cancer or diabetes or is in need of inhibition of apoptosis, e.g. a patient suffering from tissue
protein kinase. Specifically, the patient has cancer or diabetes or is in need of inhibition of apoptosis, e.g. a patient suffering from tissue injury or ischaemic injury, including stroke. The compound or composition is also useful for inhibiting the degree or rate of phosphorylation by the protein kinase. The interacting polypeptide or compound is useful in methods of stabilising a hydrophobic pocketcontaining protein kinase, where the protein kinase is exposed to the compound or polypeptide. AAB99786 to AAB9947 reppresent amino acid sequences, and AAH44210 and AAH44211 represent oligonucleotide sequences, used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Identifying modulators of protein kinase (PK) activity, useful in developing drugs for treating cancer or diabetes, by measuring the ability of the compound to modulate or mimic the interaction of PK with

                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           is
injury or ischaemic injury, including stroke. The compound or composition is also useful for inhibiting the degree or rate of phosphorylation by the protein kinase. The interacting polypeptide or compound is useful in methods of stabilising a hydrophobic pocketcontaining protein kinase, where the protein kinase is exposed to the compound or polypeptide. AAB19718 for AAB198147 represent amino acid sequences, and AAH44210 and AAH44211 represent oligonucleotide sequences, used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 une sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of
                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins

The present invention describes a method for identifying a compound that modulates protein kinase activity. The method comprises measuring the ability of the compound to inhibit, promote or mimic the interaction of a pultophobic pocket-containing protein kinase with an interacting polypeptide interacts with the hydrophobic pocket-containing polypeptide interacts with the hydrophobic pocket of the protein kinase and/or comprises the amino acid sequence. The protein kinase and/or comprises the amino acid sequence. The protein kinase and/or compounds or drugs. Compounds, polypeptides or polyputoleotides from the present invention are useful in medicine, or polyputoleotides from the present invention are useful in medicine, or particularly in the manufacture of a medicament for treating a patient or in need of modulation of signalling by a hydrophobic pocket-containing containing in hinses. Specifically, the patient has cancer or diabetes or is in need of inhibition of apoptosis, e.g. a patient suffering from tissue injury or ischaemic injury, including stroke. The compound or compound is useful for inhibiting the degree or rate of phosphorylation by the protein kinase. The interacting polypeptide or compound is useful for kinase. The interacting polypeptide or compound is useful in methods of stabilising a hydrophobic pocket-compound or polypeptide. AAB99786 to AAB9947 represent amino acid sequences, and AAH4410 and AAH4411 represent invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Identifying modulators of protein kinase (PK) activity, useful in developing drugs for treating cancer or diabetes, by measuring the ability of the compound to modulate or mimic the interaction of PK with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

The interaction relates to a mechanist the substrate of a preparation relates to a mechanist de-dependent protein kinase 1 (PDKI), by exposing it to an interacting polypeptide. Included in the invention are a preparation comprising PDKI and an interacting polypeptide. PDKI with altered specificity is useful for phosphorylating polypeptide. PDKI with altered specificity is useful for phosphorylating residue of a substrate with the following peptide contemponding to the Ser/Thr residue of a substrate with the following peptide compound identified by methods of the invention that are capable of altering the substrate specificity of PDKI. PLOSE OF PRK2 or altering the substrate specificity of PDKI, PDK2 or PRK2 signalling a compound identified by methods of the invention that are capable of the insulin signalling pathway and/or PDKI, PDK2 or PRK2 signalling a compound that is capable of reducing the activity of PDKI may be useful in treating cancer. PDKI, e.g. compound that is capable of reducing the activity of PDKI may be useful in treating cancer. Conditions in which aiding apoptosis may be useful in treating cancer. Conditions in which aiding apoptosis may be benefit in treating cancer. Conditions in which aiding apoptosis may be benefit concreased levels of inflammation. A compound capable of cobesity, or may be useful in inhibiting apoptosis. Increased activity of PDKI may successes and in treating disease in cobesity, or may be useful in inhibiting apoptosis. Increased activity of PDKI may lead to increased levels of leptin, which may lead to weight cobesity, or may be useful in inhibiting apoptosis. Increased activity of PDKI may successes and in treating disease in which apoptosis is involved. Examples of the diseases include, mechanical confirms or following cell damaging processes and in treating disease in the course of the invention.

C represents a protein kinase C related protein kinase 2 amino acid certices requence, used in the course of the invention.
                                   Substrate specificity; phosphoinositide-dependent protein kinase 1; PDK1; protein kinase C related protein kinase 2; PRK2; cancer; apoptosis; mechanical tissue damage; ischaemic disasse; stroke; myocardial infarction; antigent peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                  Altering substrate specificity of phosphoinositide-dependent protein kinase 1, to phosphorylate Ser473 in addition to Thr308 by exposing to interacting polypeptide -

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

                                                                                                                                                                                                                                                                                                                                                                 The invention comprises a method for determining whether a substance is an activator or an inhibitor of a DHAM-kinase (deregulated in hyperactive macrophage kinase). DHAM-kinases used in the invention include guarylate kinase 1 (GUK1), serin-threonin-kinase PRK2 and serin-threonin-kinase PRK2. The method of the invention is useful for identifying substances that influence inflammatory conditions of chronic inflammatory airway diseases (e.g. chronic bronchitis or chronic obstructive pulmonary serin-threonin-kinase PRK2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Protein identification; signal transduction pathway; metabolic pathway; hybridisation assay; genetic mapping; gene expression control; promoter; termination sequence.
                                                                                                                                                                                                                                                                                             Determining activators or inhibitors of 'deregulated in hyperactive macrophage' (DHAM)-kinase for treating chronic inflammatory airway diseases, by measuring DHAM-kinase function after it is contacted with a test substance
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     amino acid residues, fused to a NEMO binding sequence (AAM48525-AAM48619). The antiinflammatory compounds have antiasthmatic, cytostatic, antipsoriatic, antirheumatic, antiarthritic, osteopathic, antiabacterial, immunosuppressive, dermatological, neuroprotective, nootropic, antiatheroscletoric, virucide and antiallergic activity. The compounds act as selective inhibitors of cytokine-mediated NFkappaB activation by blocking interaction of IkappaB kinase beta (IKKbeta) at the NEMO binding domain that results in inhibition of IKKbeta kinase activation and subsequent decreased phosphorylation of IkAppaB. The compounds are useful for treating inflammatory disorders, e.g. asthma,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         lung inflammation or cancer, psoriagis, rheumatoid arthritis, osteoarthritis, inflammatcory bowel disease, sepsis, vasculitis, bursitis; autoimmune diseases such as lupus, polymyalgia, scleroderma, granulomatosis, multiple sclerosis; transplant rejection; osteoporosis; Alzheimer's disease; atherosclerosis; viral infections; and ataxia relangiactesia. The compounds are also useful for treating pro-inflammatory responses such as allergies, urticaria, anaphylaxis, drug or food sensitivity, eczema, dermatitis, sunburn, aging and
                                         Antiinflammatory; antiasthmatic; cytostatic; antipsoriatic; nootropic;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Novel antiinflammatory compound comprising membrane translocation domain fused to NEMO binding sequence, useful for blocking nuclear factor kappaB activation, and for treating asthma, lung inflammation,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      AAM48620-AAM48645), comprising a membrane translocation domain (AAM48620-AAM48627 or AAM48646-AAM48651) which comprises from 6-15
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to an antiinflammatory compound (especially

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           May MJ,
    The invention relates to modulating NF-kappaB (NF-kB) induction in a cell comprises contacting a cell with an anti-inflammatory compound (ABB00725-ABB00725-ABB00725-ABB00725-ABB00725-ABB00725-ABB00725-ABB00725-ABB00725-ABB00725-ABB00725-ABB00725-ABB00725-ABB00725-ABB00725-ABB00725-ABB00725-ABB00725-ABB00725-ABB00725-ABB00725-ABB00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-ABF00725-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            caused by Epstein-barr, cyfomegalovirus or herpes simplex. Other viral diseases include HIV and influenza. The compound may also be useful for treating anaphylaxis, drug and food sensitivity, context dermaritis, sunburn or aging. The compound may be used to replace corticosteroids in any application in which corticosteroids are used, including immunosuppression in transplants and cancer therapy. Also for identifying antiinflammatory compounds and for diagnosis of an inflammatory disorder. The compound may be administered alone or in combination with other known anti-inflammatory agents. The present sequence is that of a mutated NEMO binding domain of IKKbeta.
                                                                                                                                                                                                                                                                                                                                                                                                                                     Modulating NF-kappaB induction in a cell, useful for treating e.g. inflammatory disorders, osteoporosis and cancer, comprises contacting a cell with an anti-inflammatory compound comprising at least one NEMO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               urticāria, anaphylaxis, cutaneous inflammation, sepsis, psoriasis, rheumatorid arthritis, ostecarthritis, psoriatic arthritis, inflammatory bowel disease, chronic obstructive pulmonary disease, vasculitis and bursitis. The inflammatory disorder may also be dermatitis, eczema,

                                                                                                                                                        20-MAR-2002
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         08-NOV-2001.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Synthetic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     psoriasis
                     AAM48592
                                                                             The invention relates to an antiinflammatory compound (especially AAM48628-AAM48645), comprising a membrane translocation domain (AAM48629-AAM48645), comprising a membrane translocation domain (AAM48629-AAM48620). The AAM486651 which compounds from 6-15 anino acid residues, fused to a NEWO binding sequence (AAM48619). The antiinflammatory compounds have antiasthmatic, antibacterial, antipacriatic, antirheumatic, antiarthitic, osteopathic, corpounds act as selective inhibitors of cytokine-mediated NFkappaB compounds act as selective inhibitors of cytokine-mediated NFkappaB compounds act as selective inhibitors of cytokine-mediated NFkappaB compounds are useful for treating inflammatory disorders, e.g. asthma, lung inflammation or cancer, pooriasis, rheumatoid arthritis, actiommune diseases such as lupus, polymyalgia, scleroderma, granulomatosis, multiple sclerosis, transplant rejection; osteoporosis, catheimer's disease; atherosclerosis; viral infections; and ataxia telangiectusia. The compounds are also useful for treating to treating to treating the corpounds of scenesh, anaphylaxis, and disease atherosclerosis; viral infections; and ataxia telangiectusia. The compounds are also useful for treating and ataxia arthritis, arthritis, anticommune diseases, and setul for treating corfored or food sensitivity, eczema, dermatitis, sunburn, aging and
                                                                                          Antinflammatory; antiasthmatic; cytostatic; antipsoriatic; noctropic; antirheumatic; antiarthritic; osteopathic; antibacterial; virucide; immunosuppressive; defendation of the manatological; neuroprotective; antiatherosclerotic; antiallergic; membrane translocation domain; NEWO binding domain; eczema; cytokine; NFkappaB; IkappaB kinase beta; IKKbeta; cancer; psoriasis; rheumatoid arthritis; osteoarthritis; inflammatory bowel disease; autoimmune disorder; multiple sclerosis; transplant rejection; osteopoxosis; Alzheimer's disease; atherosclerosis; viral infection; ataxia telangiectasia; allergy; anaphylaxis; arthritis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel antiinflammatory compound comprising membrane translocation domain fused to NEMO binding sequence, useful for blocking nuclear factor kappaB activation, and for treating asthma, lung inflammation,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Phillips K;
                                                Anti-inflammatory peptide SEQ ID NO 43.

Findeis MA, Phillips K;

The invention relates to an antiinflammatory compound (especially AMM48628-AMM48645), comprising a membrane translocation domain (AMM48628-AMM48646), comprising a membrane translocation domain cand residues, fused to a NEWO binding sequence (AAM48619). The antiinflammatory compounds have antisthmatic, ortostatic, antipocriatic, antiheumatic, antiathritic, osteopathic, corpounds act as selective inhibitors of cytokine-mediated NRRappaB activation and subsequent decreased phosphorylation of IKKbeta kinase activation by blocking interaction of IkappaB kinase beta (IKKbeta kinase activation and subsequent decreased phosphorylation of IKKppaB. The compounds are useful for treating inflammatory disorders, e.g. asthma, lung inflammation or cancer, psoriasis, rheumatoid arthritis, orticalmantory bowel disease, sepsie, vasculitis, bursitis, untiple sclerosis; viral infections; and etaxia telemer's diseases such as lupus, polymyalgia, scleroderma, granulomatosis, multiple sclerosis; transplant rejection; osteoporosis; Alzheimer's diseases, and seases the compounds are also useful for treating profilemer, and seases conditions; and ataxia telangiectasia. The compounds are also useful for treating and crais arthritis; arthritis, and prompanes such as allergies, urticaria, anaphylaxis, arthritis arthritis; arthritis, and ataxia telangiectasia. The compounds are also useful for treating and ataxia arthritis; arthritis; arthritis; anaphylaxis, arthritis; arthritis; arthritis; anaphylaxis, arthritis; arthritis; anaphylaxis, arthritis; arthritis; anaphylaxis, arthritis; arth Claim 6; Page 62; 88pp; English.

The NEWO binding domains are found on IkappaB kinase-beta (IKMCAL) and IkappaB kinase-beta (IKMCAL) and IkappaB kinase-alpha (IKMCAL) proteins. The antiinflammatory compounds of the invention are useful for modulating nuclear factor-kappaB (NF-kappaB) induction in a cell, where the compounds are capable of blocking the interaction on the new or more IKMS such as IKMCAlpha or IKMCheta, and NEMO. The antiinflammatory compound further comprises at least one membrane translocation domain. The compounds are useful for treating inflammatory disorders, autoimmune diseases, osteoporosis, cancer, althamatory disorders, autoimmune diseases, osteoporosis, cancer, Alzheimer's disease, atherosclerosis, viral infections, Ataxia tell invention block NF-kappaB induction by IKK but do not inhibit the basal activity of NF-kappaB. AMM48620-AMM48645), comprising a membrane translocation domain (APM48620-AMM48645), comprising a membrane translocation domain (AAM48620-AMM48645), comprising a membrane translocation domain amino acid residues, fused to a NEMO binding sequence (AAM48620-AAM48619). The antiinflammatory compounds have antiasthmatic, cytostatic, antipsoriatic, antitheumatic, antiarthritic, osteopathic, antiatherosclerotic, virucide and antiallergic activity. The compounds act as selective inhibitors of cytokine-mediated NFkappaB compounds act as selective inhibitors of cytokine-mediated NFkappaB activation by blocking interaction of IkappaB kinase beta (IKKbeta) at the NEMO binding domain that results in inhibition of IKkbeta kinase activation and subsequent decreaced phosphorylation of IKkpeta kinase activation and subsequent decreaced phosphorylation of IKkpeta kinase activation and subsequent decreaced phosphorylation of IKkpeta kinase compounds are useful for treating inflammatory disorders, e.g. asthma, ungitial antimities, osteoparthritis, inflammatory bowel disease, seepsis, vasculitis, osteoparthritis, inflammatory bowel disease, sepsis, vasculitis, granulomatosis, multiple sclerosis; transplant rejection; osteoporosis; Alzheimer's disease; atherosclerosis; viral infections; and ataxia telangiactasia. The compounds are also useful for treating anaphylaxis, pro-inflammatory responses such as allergies, urticaria, anaphylaxis,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Antinflammatory; antiasthmatic; cytostatic; antipsoriatic; nootropic; antirheumatic; antiarthritic; osteopathic; antibacterial; viruide; immunosuppressive; dermatological; neuroprotective; antiatherosclarotic; antiallergic; membrane translocation domain; NEWO binding domain; eczema; cytokine; NFkappaB; IkappaB kinase beta; IKKbeta; cancer; psoriasis; rheumatoid arthritis; osteoarthritis; inflammatory bowel disease; autoimmune disorder; multiple sclerosis; transplant rejection; osteoporosis; Alzheimer's disease; atherosclerosis; viral infection; ataxia telangiectasia; allergy; anaphylaxis; arthritis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          AAM48628-AAM48645), comprising a membrane translocation domain (AAM48620-AMM4861) which comprises from 6-15 amino acid residues, fused to a NEWO binding sequence (AAM48619). The antiinflammatory compounds have antiasthmatic, Cytostatic, antipsoriatic, antirheumatic, antibacteric, originaritic, osteopathic, antibacterial, immunosuppressive, dermatological, neuroprotective, nootropic, antiatherosclerotic, virucide and antiallergic activity. The
bursitis; autoimmune diseases such as lupus, polymyalgia, scleroderma, granulomatosis, multiple sclerosis; transplant rejection; osteoporosis; Alzheimer's disease; atherosclerosis; viral infections; and ataxia telangiectasia. The compounds are also useful for treating pro-inflammatory responses such as allergies, urticaria, anaphylaxis, drug or food sensitivity, eczema, dermatitis, sunburn, aging and arthritis.

compounds act as selective inhibitors of cytokine-mediated NFkappaB activation by blocking interaction of IkappaB kinase beta (IKKbeta) at the NEWO binding domain that results in inhibition of IKKbeta kinase activation and subsequent decreased phosphorylation of IkappaB. The compounds are useful for treating inflammatory disorders, e.g. asthma, lung inflammation or cancer, psoriasis, rheumatory disorders, e.g. asthma, osteoarthritis, inflammatory bowel disease, sepsis, vascultis, bursitis, autoimmune diseases such as lupus, polymyalgia, scleroderma, bursitis, autoimmune diseases such as lupus, polymyalgia, scleroderma, granulomatosis, multiple sclerosis; transplant rejection; osteoporosis, Alzheiner's disease; atherosclerosis; viral infections; and ataxia telangiectasia. The compounds are also useful for treating pro-inflammatory responses such as allergies, utiliamia, anaphylaxis, drug or food sensitivity, eczema, dermatitis, sunburn, aging and

```

The invention relates to an antiinflammatory compound (especially AAM48628-AAM48645), comprising a membrane translocation domain

Claim 6; Page 62; 88pp; English.

```
(AAM48525-AAM48619). The antinflammatory compounds have antiasthmatic, cytostatic, antipostriatic, antinflammatory compounds have antiasthmatic, cytostatic, antipostriatic, antimostriatic, antimostriatic, antimostriatic, antimostriatic, dermatological, neuroprotective, nootropic, antiatherosclerotic, virucide and antiallergic activity. The compounds act as selective inhibitors of cytokine-mediated NFkappaB compounds act as selective inhibitors of cytokine-mediated NFkappaB compounds are useful for treating inflammatory disorders, e.g. asthma, lung inflammation or cancer, psociasis, rheumatoid arthritis, osteoarthritis, inflammatory bowel disease, sepsis, vasculitis, dranning diseases such as lupus, polymyladia, scleroderma, granulomatosis, multiple sclerosis, transplant rejection; osteoprosis; dranning compounds are also useful for treating inflammatoris, and ataxia the compounds are also useful for treating centering inflammatoris, and ataxia the compounds are also useful for treating centering cente

The invention relates to an antiinflammatory compound (especially AAM48629, comprising a membrane translocation domain (AAM48620-AAM48619), comprising a membrane translocation domain (AAM48620-AAM48619). The antiinflammatory compounds have antiathmatic, amino acid residues, fused to a NEMO binding sequence (AAM48525-AAM48619). The antiinflammatory compounds have antiathmatic, antipacterial, immunosuppressive, dermatological, neuroprotective, ortipacterial, immunosuppressive, dermatological, neuroprotective, nootropic, antiatherosclerocic, virucide and antiallergic activity. The compounds act as selective inhibitors of cytokine-mediated NFkappaB cativation by blocking interaction of IkappaB kinase beta (IKKbeta) at the NEMO binding domain that results in inhibition of IKkpeta kinase activation and subsequent decreased phosphorylation of IkappaB. The compounds are useful for treating inflammatory disorders, e.g. asthma, inflammatory no cancer, psoriasis, rheumatory disorders, e.g. asthma, osteoarthritis, inflammatory bowel disease, sepsis, vasculitis, osteoarthritis, inflammatory bowel disease, sepsis, vasculitis, undiminantory bowel disease, sepsis, vasculitis, and ataxia telangiectasia. The compounds are also useful for treating inflammatory responses such as allergies, unicaria, and ataxia telangiectasia. The compounds are also useful for treating provinced and allergies, unicaria, and ataxia decreases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    antirheumatic; antiarthritic; osteopathic; antibacterial; virucide; immunosuppressive; darmatological; neuroprotective; antiatheroscalerotic; antiallergic; membrane translocation domain; NEWO binding domain; eczema; cytokine; NFkappaB; IkappaB kinase beta; IKKbeta; cancer; psoriasis; rheumatoid arthritis; osteoarthritis; inflammatory bowel disease; autoimmune disorder; multiple sclerosis; transplant rejection; osteoporosis; Alzheimer's disease; atherosclerosis; viral infection;

The invention relates to an antiinflammatory compound (especially AAM48628-AAM48645), comprising a membrane translocation domain (AAM48628-AAM48629), comprising a membrane translocation domain (AAM48629-AAM48629). The AAM486519 which comproises from 6-15 amino acid residues, fused to a NERWO binding sequence (AAM48619). The antiinflammatory compounds have antiasthmatic, cytostatic, antipsoriatic, antirheumatic, antiarthritic, osteopathic, antibacterial, immunosuppressive, dermatological, neuroprotective, antibacterial, immunosuppressive, virucide and antiallergic activity. The compounds act as selective inhibitors of cytokine-mediated NERapaB activation by blocking interaction of IxapaB kinase beta (IKKbeta) at the NEWO binding domain that results in inhibition of IxapaBs. The compounds are useful for treating inflammatory disorders, e.g. asthma, lung inflammation or cancer, bowel disease, sepsis, vasculitis, bursitlammatory bowel disease, sepsis, vasculitis, bursitial autoimmune diseases such as lupus, polymyalgia, scleroderma, granulomatosis, multiple sclerosis; viral infections; and ataxia telangiectasia. The compounds are also useful for treating conflammatory responses such as allergies, urticaria, anaphylaxis, arthritis, anticonflammatory responses such as allergies, urticaria, anaphylaxis, arthritis, anticonflammatory responses such as allergies, urticaria, anaphylaxis, arthritis, anticonflammatory responses such as allergies, urticaria, anaphylaxis, anticonflammatory descena, dermatitis, sunburn, aging and
                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel antiinflammatory compound comprising membrane translocation domain fused to NEMO binding sequence, useful for blocking nuclear factor kappaB activation, and for treating asthma, lung inflammation,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Claim 6; Page 62; 88pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to an antiliniammatory compound (expectation)

AMM48620-AMM48645), comprising a membrane translocation domain

(AAM48620-AMM48645), comprising a membrane translocation domain

(AAM48620-AMM48627 or AAM48646-AAM48651) which comprises from 6-15

amino acid residues, fused to a NEWO binding sequence

(AAM48525-AAM48619). The antiinflammatory compounds have antiasthmatic,

crostatic, antistoriatic, antiinflammatory compounds have antiasthmatic,

antibacterial; immunosuppressive, dermatological, neuroprotective,

compounds act as selective inhibitors of cytokine-mediated NEKAppaB

activation by blocking interaction of IkappaB kinase beta (IKKbeta) at

the NEMO binding domain that results in inhibition of IKKbeta kinase

activation and subsequent decreased phosphorylation of IKAppaB. The

compounds are useful for treating inflammatory disorders, e.g. asthma,

compounds are useful for treating inflammatory disorders, e.g. asthma,

compounds are useful for treating inflammatory disorders, e.g. asthma,

compounds are useful for treating inflammatory disorders, e.g. asthma,

compounds are useful for treating inflammatory disorders, e.g. asthma,

compounds are useful for treating inflammatory disorders, e.g. asthma,

compounds are diseases such as lupus, polymyalgia, scleroderma,

granulomatosia, multiple sclerosis, transplant rejection; osteoporosis,

clangiectasia. The compounds are also useful for treating

pro-inflammatory responses such as allergies, urticaria, anaphylaxis,

chang or food sensitivity, eczema, dermatitis, sunburn, aging and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                 domain fused to NEMO binding sequence, useful for blocking nuclear factor kappaB activation, and for treating asthma, lung inflammation,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

AMM48620-AMM48645), comprising a membrane translocation domain.

(AAM48620-AMM48645), comprising a membrane translocation domain and residues, fused to a NEMO binding sequence.

(AAM48520-AMM48619). The antiinflammatory compounds have antiasthmatic, cytostatic, antipsoriatic, antiinflammatory compounds have antiasthmatic, antibacterial, immunosuppressive, dermatological, neuroprotective, ontorpic, antiatherosclerotic, virucide and antiallergic activity. The compounds act as selective inhibitors of cytokine-mediated NFkappaB activation by blocking interaction of IkappaB kinase beta (IKKbeta) at the NEMO binding domain that results in inhibition of IKkbeta kinase activation and subsequent decreased phosphorylation of IKAppaB. The compounds are useful for treating inflammatory disorders, e.g. asthma, lung inflammation or cancer, psoriasis, rheumatoid arthritis, osteoparessis, costeoarthritis, inflammatory bowel disease, sepsis, vasculitis, bursitis; autoimmune diseases such as lupus, polymyalgia, scleroderma, granulomatosis, multiple sclerosis, transplant rejection, osteoporosis, continents and seases atherocalenosis; viral infections; and ataxia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Antiinflammatory; antiasthmatic; cytostatic; antipsoriatic; nootropic;
                                                                                                                                                                                                                                                                                                                                                                                                   Novel antiinflammatory compound comprising membrane translocation domain fused to NEMO binding sequence, useful for blocking nuclear factor kappaB activation, and for treating asthma, lung inflammation,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           telangiectasia. The compounds are also useful for treating pro-inflammatory responses such as allergies, urticaria, anaphylaxis, drug or food sensitivity, eczema, dermatitis, sunburn, aging and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
osteoporosis; Alzheimer's disease; atherosclerosis; viral infection;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to an antiinflammatory compound (especially

                                                                                                                                                                                                                                                                   -I-FUNCTION: Suppresses apoptosis in a variety of cell systems including factor-dependent lymphohematopoietic and neural cells. Regulares cell death by controlling the mitochondrial membrane permeability. Appears to function in a feedback loop system with caspases. Inhibite caspase activity either by preventing the release of cytochrome c from the mitochondria and/or by binding to the apoptosis-activating factor (APAF-1) (By similarity).

-I-SUBUNI: Forms homodimers, and heterodimers with BAX, BAD, BAK and BCl-x(L). Heterodimerization with BAX requires intact BH1 and BH2 domains, and is necessary for anti-apoptotic activity (By similarity).

-I-SUBCELLUIAR LOCATION: Outer mitochondrial membrane, intracellular membrane of the nuclear envelope and the endoplasmic reticulum (By
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            similarity).
DOMAIN: The BH4 domain is required for anti-apoptotic activity and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                for interaction with RAF-1 (By similarity).

PTM: Phosphorylation/dephosphorylation on Ser-70 regulates Bcl2 anti-apoptotic activity. Growth factor-stimulated phosphorylation on Ser-70 by PKC is required for the anti-apoptosis activity and occurs during the G2/M phase of the cell cycle (By similarity). In the absence of growth factors, Bcl2 appears to be phosphorylated by other protein kinases such as ERKs and stress-activated kinases. Dephosphorylated by protein phosphatase 2A (PP2A) (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 PTMILE Protective all y cleaved by caspases during apoptosis. The cleaved protein, lacking the BH4 domain, has pro-apoptotic activity, causes the release of cytochrome c into the cytosol promoting further caspase activity (By similarity).

SIMILARITY: Contains 1 Bc1-2 homology 2 (BH2) domain.

Librochem. Biophys. Res. Commun. 281:404-408 (2001).

Librochem. Biophys. Res. Commun. 1940 (2001).

Regulates cell death by controlling the mitochondrial membrane permeability. Appears to function in a feedback loop system with Caspases. Inhibits caspase activity either by preventing the release of cytochrome c from the mitochondria and/or by binding to the apoptosis-activating factor (APAF-1) (By similarity).

Lesubulti. Forms homodimers, and heterodimers with BAX. BAD, BAK and Bcl.x(L). Heterodimerization with BAX requires intact BHI and BHI domains, and is necessary for anti-apoptotic activity (By commingratity). Also interacts with APAF-1 and RAF-1 (By similarity).

LesubcEllular LoCaTION: outer mitochondrial membrane, intracellular membrane of the nuclear envelope and the endoplasmic reticulum.

Cell DOMAIN: The BH4 domain is required for anti-apoptotic activity and cortive mitorial membrane of the nuclear envelope and the endoplasmic reticulum.

Cell DOMAIN: The BH4 domain is required for anti-apoptotic activity and cortive with RAF-1 (By similarity).

The apoptotic activity. Growth factor-stimulated phosphorylation on Ser-70 by RC is required for the anti-apoptosis activity and occurs during the G2/M phase of the cell cycle (By similarity). In the absence of growth factors, when the anti-apoptotic activity is by other protein kinases such as BRKs and stress-activated kinases and stress-activated whosphared and stress activity of Ray, and sinilarity).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Tomicic M.T., Kaina B.; "Hamster Bcl-2 protein is cleaved in vitro and in cells by caspase-9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Tomicic M.T., Christmann M., Kaina B.; "Cloning and functional analysis of cDNA encoding the hamster Bcl-2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         (By similarity).
PTM: Proteolytically cleaved by caspases during apoptosis. The cleaved protein, lacking the BH4 domain, has pro-apoptotic activity, causes the release of cytochrome c into the cytosol promoting further caspase activity.
SIMILARITY: Contains 1 Bcl-2 homology 1 (BH1) domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Cricetulus longicaudatus (Long-tailed hamster) (Chinese hamster).

5. Cherrol Suppresses apoptosis in a variety of cell systems including factor-dependent lymphohematopoietic and neural cells.

Regulates cell death by controlling the mitochondrial membrane caspasses. Inhibits caspasse activity either by preventing the caspasses. Inhibits caspasse activity either by preventing the release of cytochrome c from the mitochondria and/or by binding to the apoptosis-activating factor (APAF-1).

3. Subultir: Forma homodimers, and hererodimers with BAX requires intact BH1 and BH2 domains, and is necessary for anti-apoptotic activity (By similarity). Also interacts with APAF-1 and RAF-1.

5. SUBCELLULAR LOCATION: Outer mitochondrial membrane, intracellular membrane of the nuclear envelope and the endoplasmic reticulum.

6. HATERMATIVE POWDICTS:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This SWISS-PROT entry is copyright.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Dephosphorylated by protein phosphatese 24 (PP2A).

-1- PTM: Proteolytically cleaved by caspases during apoptosis. The cleaved protein, lacking the BH4 domain, has pro-apoptosic activity, causes the release of cytochrome c into the cytosol promoting further caspase activity.

-1- SIMILARITY: Contains 1 BCl-2 homology 1 (BH1) domain.
-1- SIMILARITY: Contains 1 BCl-2 homology 3 (BH2) domain.
-1- SIMILARITY: Contains 1 BCl-2 homology 3 (BH3) domain.
-1- SIMILARITY: Contains 1 BCl-2 homology 4 (BH4) domain.
-1- SIMILARITY: Contains 1 BCl-2 homology 4 (BH4) domain.
                                                                                                                      PHOSPHORYLATION BY PKC, AND MUTAGENESIS OF SERINE RESIDUES.                                                                                                                              reconstructions of the mode of the microbardian and the microbardian membrane including factor-dependent lymphohematopoietic and neural cells.

C -!- FUNCTION: Suppresses apoptosis in a variety of cell systems including factor-dependent lymphohematopoietic and neural cells. Regulates cell death by controlling the microbardian membrane permeability. Appears to function in a feedback loop system with caspases. Inhibite caspase activity either by preventing the release of cytochrome c from the microhondria and/or by binding to the apoptosis-activating factor (APAF-1).

C -!- SUBNIT: Forms homodimers, and heterodimers with BAX mand belax(L). Heterodimerization with BAX requires intact BH1 and BH2 domains, and is necessary for anti-apoptotic activity (By similarity). Also interacts with ABAF-1 and RAF-1 (By similarity).

C -!- SUBCELLULAR LOCATION: Outer mitochondrial membrane, intracellular membrane of the nuclear envelope and the endoplasmic reticulum.

C -!- SUBCELLULAR LOCATION: Expressed in a variety of tissues, with highest levels in reproductive tissues. In the adult brain, dexpression is localized in mitral cells of the olfactory bulb, granule and pyramidal neurons of hippocampus, pontine nuclei, cerebellar granule neurons, and in ependymal cells. In prenatal and pyramidal neurons and in ependymal cells. In prenatal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Drain, expression is inguist and incentered in the control plate.

C -!- DOMAIN: The BH4 domain is required for anti-apoptotic activity and for interaction with Rak-1 (By similarity).

C -!- PTM: Phosphorylation/dephosphorylation on Ser-70 regulates BC12 anti-apoptotic activity. Growth factor-stimulated phosphorylation on Ser-70 by PKC is required for the anti-apoptosis activity and occurs during the G2/M phase of the cell cycle. In the absence of growth factors, Bc12 appears to be phosphorylated by other protein kinases such as ERKs and stress-activated kinases.

C growth factors, Bc12 appears to be phosphorylated by other protein kinases such as ERKs and stress-activated kinases.

Dephosphorylated by protein phosphatases and similarity).

C -!- PTM: Proteolytically cleaved by caspases during apoptosis. The cleaved protein, lacking the BH4 domain, has pro-apoptotic activity, causes the release of cytochrome c into the cytosol promoting further caspase activity (By similarity).

C -!- SIMILARITY: Contains 1 Bc1-2 homology 1 (BH1) domain.

C -!- SIMILARITY: Contains 1 Bc1-2 homology 4 (BH4) domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This SWISS-PROT entry is copyright.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              -i- FUNCTION: Synthesizes alpha-1,4-glucan chains using ADP-glucose.
-!- CATALYTIC ACTIVITY: ADP-glucose + { (1,4)-alpha-D-glucosyl} (N) = ADP + { (1,4)-alpha-D-glucosyl} (N+1).
-!- PATHWAY: Glycogen biosynthesis; second step.
-!- SIMILARITY: Belongs to the glycosyltransferase family 1.
Bacterial/plant glycogen synthase subfamily.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     STRAIN=R1 / ATCC 13939 / DSM 20539 / NCIB 9279;
